

SOILMIX

Soiltech is both pioneer and market leader in the soilmix technique in Belgium. This new technique has been developed thanks to Soiltech's commitment and expertise. Soiltech laid the foundations for both the practical execution and theoretical approach and documented the technique en calculation method in its CUR-handbook.

This vibration-free technique for the installation of foundation and sheet pile walls uses the excavated soil as basic material for the CSM-mixture, thus resulting in minimal residual fractions.

The technique is extremely suited for sheet piling building pits, for installing water-resistant walls and foundations of buildings, next to existing constructions or not, or for stabilising the subsoil.

With its machines, Soiltech can install soilmix walls up to a depth of 34 metres.
