

BORED PILES

In early 2016, we bought extra equipment for installing bored piles with a large diameter. Using the so-called Kelly technique, piles with a diameter up to 1800 mm can be installed up to 40 metres deep, both in soft soils and across hard rock layers. Next to projects in Belgium, the Netherlands and France, Soiltech also successfully executed the pile foundations for a new quay wall in Panama. The piles of this quay wall, partly enclosed in a permanent steel casing, were drilled into basalt rock. In other words, Soiltech isn't afraid of taking on complex international contracts.
