

GRAVEL CORES

Soiltech has the necessary expertise to offer a comprehensive range of soil improvement techniques. Next to vibroflotation and DCM (deep cement mixing), Soiltech also installs gravel cores. Thanks to its multifunctional equipment, which can be used for the soilmix technique and the installation of secant piles and gravel cores, Soiltech can mobilise several machines. In this way, large-scale projects can be executed within a short period of time. In Ostend, for instance, we deployed four machines at the same time to fit out in record speed a complete site with gravel cores made from recovered concrete rubble. Meanwhile, we already successfully completed several very diverse projects in Belgium.
